The Kennel Club

PHPT Tests

Below is a list of Kennel Club registered dogs of the breed specified above, together with their sire and dam, giving the date that they were DNA tested for the dominantly inherited disease specified above. The test distinguishes between clear (no copies of the mutant gene) and affected dogs. The test reveals two categories of affected dogs. Single affected dogs are dogs with one normal copy of the gene and one mutant copy; double affected dogs have two copies of the mutant gene. Note that the progeny of a clear sire and clear dam will also be clear (hereditarily clear), and the progeny of two hereditarily clear, or one hereditarily clear and one tested clear dog will also be hereditarily clear. Further information on this scheme can be obtained from the Kennel Club.

Dog Name	Reg/Stud No	DOB	Sex	Sire	Dam	Test Date	Result
BREED: KEESHOND
